

LAB 10_Previous Value Tracking Using useRef_ANP-D1840

Task 1:

Create a text input. When the user types something, show:

- the **current value**
- the **previous value**

Use **only useState and useRef**.

Task 2:

Inside the onChange function:

- First store the **old value** in useRef
- Then update the **current value** using useState

Task 3:

Display the previous value on the screen.

If the input is empty, show “-” instead.

Task 4:

Add simple CSS to make the output look neat.

(Example: card style, border, padding, center alignment)

Task 5:

User types:

A → AB → ABC

Typing	Current (text)	Previous (prevValueRef.current)
"A"	A	""
"B"	AB	A
"C"	ABC	AB
