

Week5 Session 1- Interview Questions

1. What is Node.js, and why is it popular?

Node.js is an open-source, cross-platform JavaScript runtime environment that executes JavaScript code outside a web browser. It is popular because it uses a non-blocking, event-driven architecture that is ideal for building scalable and high-performance applications.

2. How does Node.js differ from other JavaScript runtime environments?

Unlike traditional JavaScript environments that run in a browser, Node.js runs JavaScript on the server. It uses the V8 JavaScript engine, allowing for fast execution, and supports non-blocking I/O operations for high concurrency.

3. What are the main features of Node.js?

Main features of Node.js are as follow:-

- Asynchronous and Event-Driven: Handles multiple requests efficiently without blocking.
- Single-Threaded Architecture: Achieves scalability using an event loop.
- Fast Execution: Powered by Google's V8 engine.
- NPM: Provides access to a large repository of open-source libraries.
- Cross-Platform: Compatible with multiple operating systems

4. What is npm, and why is it used in Node.js?

NPM (Node Package Manager) is a package manager for Node.js. It is used for installing, managing, and sharing libraries and dependencies for Node.js applications.

5. What is non-blocking I/O in Node.js?

Non-blocking I/O allows Node.js to handle multiple requests without waiting for one to finish, improving performance.

6. Name some real-world applications built with Node.js.

Some real world applications built with Node.js are :-

- Netflix: Streaming platform
- LinkedIn: Backend API
- Walmart: E-commerce
- PayPal: Payment gateway
