

Week5 Session-3 Interview Questions

1. What is NPM, and how does it relate to Node.js?

NPM (Node Package Manager) is a tool that comes with Node.js for managing and sharing JavaScript packages. It allows developers to:

- Install libraries/packages.
- Manage project dependencies.
- Share reusable code.

2. What is the purpose of package.json in a Node.js project?

package.json is a configuration file that stores metadata about the project, including:

- Project name, version, and description.
- Dependencies and devDependencies.
- Scripts for automating tasks.

3. Explain the role of package-lock.json.

package-lock.json locks the versions of dependencies to ensure consistent installations across different environments. It records the exact version of each package and its sub-dependencies.

4. What happens if a required package is missing in a Node.js project?

If a required package is missing, Node.js throws a `MODULE_NOT_FOUND` error during runtime.

5. How can you ensure your project works the same across different environments?

By committing both `package.json` and `package-lock.json` to version control, ensuring consistent dependency versions across environments.

6. What is the command to list globally installed NPM packages?

Use the following command:

```
npm list -g --depth=0
```

7. How does fs.mkdir() differ from fs.mkdirSync()?

Difference between `fs.mkdir()` and `fs.mkdirSync()`:-

- `fs.mkdir()`: Asynchronously creates a directory.
- `fs.mkdirSync()`: Synchronously creates a directory.
