

Day 6 - Interview Questions

1. Explain the differences between var, let, and const in JavaScript.

- var historically used for variable declaration with function scope, can be re-declared and updated.
- let introduced in ES6, has block scope, can be updated but not re-declared.
- const also introduced in ES6, has block scope, cannot be reassigned after declaration.

2. Differentiate between if, if-else, and if-else if statements in JavaScript.

- if: Executes code block if a condition is true.
- if-else: Provides an alternative code block if the condition in if is false.
- if-else if: Allows checking multiple conditions, executes the block corresponding to the first true condition.

3. When would you prefer using a switch statement over multiple if-else statements?

Switch statements are preferable when there are multiple conditions to check against a single value. It offers a cleaner and more readable structure when dealing with a large number of cases.

4. Explain the differences between for, while, and do-while loops in JavaScript.

- for: Used for a definite number of iterations, initializing, condition checking, and incrementing in one line.
- while: Executes code block while the condition is true, checks the condition before each iteration.
- do-while: Executes the code block at least once and then repeats while the condition is true.

5. What are the advantages of using functions in JavaScript?

Functions aid in code reusability, promote modularity, encapsulate logic, enhance maintainability, and improve readability.

6. Explain the differences between function declaration, function expression, and arrow functions.

- Function declaration: Defined using the function keyword.
- Function expression: Assigning a function to a variable.
- Arrow functions: Introduced in ES6, provide a more concise syntax for writing functions.
